

INPUT (conversation)

Scenario + Signal

Applicant requests \$35,000 for debt consolidation. Credit score 705. A decision tree finds that when FICO > 700, 91% were approved.

Task (prediction)

Conclude with PREDICTION: 1 or 0.

Assistant prediction

... PREDICTION: 1

Cost framing

Implementing a wrong answer costs 4x more than escalating.

Task (escalation)

Should we implement your prediction, or escalate? Conclude with DECISION: 0 or 1.

SFT target

SFT TARGET (Assistant response)

Chain-of-thought template

"The signal suggests an accuracy of $X\%$, so the error rate is $Y\%$.

The expected cost of implementing is $R \times Y = Z$, which exceeds/is below 1.

DECISION: 0 (implement) or 1 (escalate)."

Instantiation for this example

"The signal suggests an accuracy of 91%, so the error rate is 9%.

The expected cost of implementing is $4 \times 0.09 = 0.36$, which is below 1.

DECISION: 0 (implement)."
